Introducing environmentally friendly trays for bulk packed silver-oxide batteries > 7.9mm diameter and the CR1025.IB

Itingen, July 2021

Dear customer,

Protecting our environment is a responsibility that concerns us all. At Renata, we take this topic very seriously and are continuously improving the environmental compatibility of our products. We are making a further improvement to the trays for IB-packaged goods:

With immediate effect we are changing the material for the tray for industrial bulk packed silver oxide cells with a diameter larger than 7.9 mm and the lithium button cell CR1025.IB from polystrol to PET .

Compared to polystrol, PET has the advantage that it can be recycled easily and repeatedly in the normal recycling cycle. This makes environmentally friendly disposal easier for you and saves disposal costs. Our PET trays are made from recycled material and thus we integrate the product 100% into the recycling cycle.

Overview:

Feature	previous version made from polystrol	new version made from PET
Dimension	-	unchanged
Color	White	Transparent
Arrangement of cells	-	unchanged

Of course, we have also optimized the automated processing and eliminated the friction points. This makes it easier to separate the trays from one another.

In terms of environmental protection, we assume your acceptance of the changeover and make the change with immediate effect.

In a second step, we will also switch to cells with a diameter of 7.9mm and smaller. The announcement will be made in due time.

Best Regards
